COTTON QUALITY, UNITED STATES

Supply - Disappearance - Carry-over

1964-65

Introduction

This report contains information on the quality of cotton on hand in the United States on August 1, 1965, and on the quality of cotton in the crop, supply, and disappearance during the 1964-65 season. To facilitate comparison certain data for previous years are included.

Quality estimates for the carry-over include statistics on the grade and staple of upland and American-Egyptian cotton and on the staple of cotton of foreign growth in the United States on August 1, 1965. Estimates on the quality of cotton in public storage including CCC stocks as of August 1, 1965 were based on actual re-sampling and classification of a representative proportion of these stocks. The quality of cotton stored in consuming establishments was based on grade and staple data furnished by the establishments in which the cotton was stored. Sample data were compiled for each state and were raised to the total number of bales reported by the Bureau of the Census in public storage and in consuming establishments for upland, American-Egyptian and foreign growths.

The August 1, 1965 carry-over of upland cotton in the United States contained the smallest proportion of Middling and higher White grades in end-season stocks since 1958. The proportion of White grades below Middling was the largest since 1957. Light Spotted cotton comprised a smaller proportion of the carry-over than in either of the two preceding years. Spotted and other Colored cotton accounted for the largest proportion of end-season stocks in six years. The grade index of the 1965 upland carry-over stocks decreased for the fifth consecutive year and was the lowest since 1958.

The staple distribution of upland cotton in the 1965 carry-over was about unchanged from a year earlier. The average staple of end-season stocks was 32.4 thirty-seconds inches compared with the average of 32.3 thirty-seconds for the 1964 carry-over. Cotton stapling 1" and shorter accounted for 38 percent of the total 1965 carry-over. The two lengths, 1-1/32" and 1-1/16", comprised 54 percent of end-season stocks while the lengths longer than 1-1/16" accounted for nearly eight percent of total upland stocks on August 1, 1965.

The quality of American-Egyptian cotton on hand on August 1, 1965 was virtually unchanged from a year earlier. Grades 4 and higher accounted for 87 percent of total carry-over stocks, the same proportion as in 1964 end-season stocks. American-Egyptian cotton in the lengths 1-3/8" and shorter comprised 91 percent of the 1965 carry-over against 85 percent in these lengths a year earlier.

Cotton tenderable in settlement of futures contracts in the 1965 carry-over totaled 8,666,000 bales, equivalent to 62 percent of the total. This is based on the quantity of cotton tenderable with respect to grade and staple only and does not take into consideration cotton reduced for cause or cotton below minimum micronaire requirements.

The United States carry-over of all kinds of cotton totaled 14,291,000 bales on August 1, 1965, according to the Bureau of the Census. This was the second largest carry-over on record, surpassed only by the 1956 carry-over of 14,529,000 bales. End-season stocks on August 1, 1964 totaled 12,378,000 bales. Stocks of upland cotton in the 1965 carry-over totaled 14,018,000 bales, American-Egyptian stocks were 205,000, and foreign growths totaled 67,000 bales.
