## Cotton Quality - United States

1972 Crop

### Introduction

The quality of cotton ginned in the United States from the 1972 crop is presented in this report. These quality estimates are based on the classification of samples representing approximately ten percent of the 1972 crop. The sample distributions of the various qualities of upland and American Pima cotton were raised to total ginnings as reported by the Bureau of the Census.

Quality statistics on the grade, staple, mike and fiber strength of the 1972 crop, by Smith-Doxey cotton classing office territories, by major cotton-producing states and by specified periods are presented in this report.

A report covering the qualities of cotton on hand in the United States on August 1, 1973, by principal types of storage, was released in mid-September. In addition to quality estimates of cotton in the carryover, this report included quality data on the crop, supply and disappearance of upland cotton for the 1972-73 season with comparative data for preceding years.

\*\*\*\*\*

The 1972 upland crop contained nearly 1.0 million bales of cotton stapling 36 and longer. This is equivalent to eight percent of total ginnings, a substantial decrease from a year earlier when these longer staples comprised 16 percent of the crop. Cotton in the lengths 35 and 34, combined, was equivalent to about 56 percent of 1972 ginnings compared with 58 percent a year ago. Staples 33 and 32 comprised 19 percent of total ginnings, up sharply from the eight percent in the 1971 ginnings. Cotton stapling 31 and shorter accounted for 17 percent of the 1972 upland crop, the smallest percentage in three years. The average staple of the 1972 crop was 33.5 thirty-seconds inches against 33.8 thirty-seconds for the 1971 crop.

Ginnings of grade 31 and higher White grades totaled 1.1 million bales in 1972-73, representing eight percent of the total crop. This is the smallest percentage of these higher White grades for any crop on record and compares with the previous record-low of 13 percent set in 1971-72. The White grades below 31 comprised the largest percentage of ginnings - 60 percent - for any season since quality data became available. Grade 51 accounted for 20 percent of 1972 ginnings, a record-high. The Light Spotted grades were equivalent to 24 percent of total ginnings, the smallest percentage in eight years. The grade index of the 1972 crop was 89.2 (grade 31 = 100), the lowest on record.

The average mike of upland cotton ginned from the 1972 crop was 4.2 compared with 4.1 a year earlier. Cotton miking in the 3.5-4.9 mike category comprised 78 percent of total ginnings against 77 percent in the 1971-72 season.

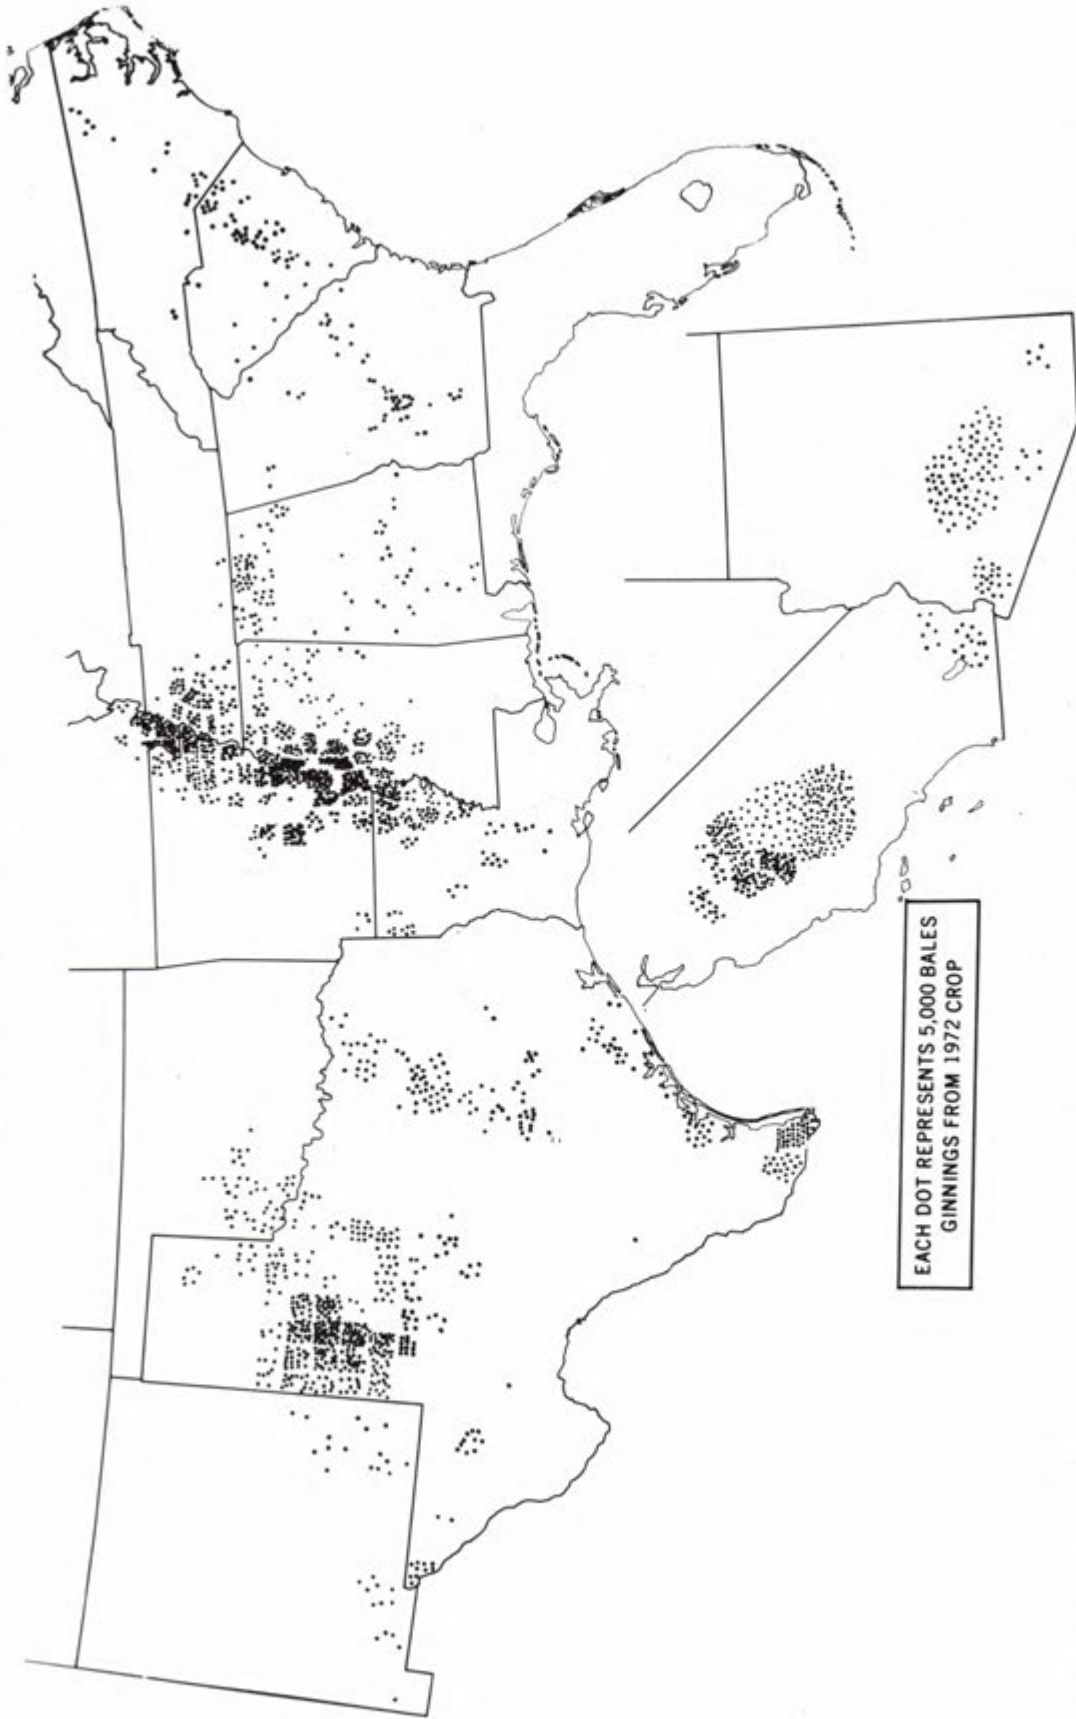

Fiber strength test results showed that upland cotton ginned from the 1972 crop was stronger than a year earlier. The average was 84,000 pounds per square inch compared with 82,000 pounds in the 1971-72 season. Cotton in the 80,000-89,000 fiber strength range comprised 51 percent of total ginnings against 45 percent for the 1971 crop. Cotton testing 90,000 pounds and stronger accounted for 20 percent of ginnings compared with 14 percent a year earlier.

American Pima cotton ginned from the 1972 crop contained smaller proportions of the longer staples and the higher grades than a year ago. The staples 46 and longer accounted for four percent of ginnings compared with 19 percent a year ago. Grades 3 and higher comprised eight percent of total ginnings, down sharply from the 30 percent in these higher grades in the preceding season.

Cotton ginned from the 1972 crop totaled 13,267,000 running bales, according to the Bureau of the Census. This is the largest crop since 1965 and compares with 1971 ginnings of 10,229,000 bales. The average net weight per bale of cotton ginned from the 1972 crop was 495.7 pounds compared with the 1971 average bale weight of 491.6 pounds and the 1970 average of 483.8 pounds per bale. The 1972 American Pima crop totaled 93,900 running bales compared with 95,900 bales from the 1971 crop.
