How to Make Glowing Eyeballs with littleBits

What you’ll need

- battery/cord
- power
- button
- branch
- long LED x2

**STEPS**

1. Connect the battery to the cord. The cord should only attach to the battery nodes one way.

2. Plug the adaptor from the battery cord to the power.

3. Attach the button to the power. The magnets will only attach in the correct direction. Try matching the circled x’s on each piece.

4. Attach the branch to the open side of the button.

5. Attach the long LEDs to the two sides of the branch. The magnets will only attach in the correct direction. Just test each side until the magnets connect.

6. Make sure the switch on the power piece is set to ON.

7. Adjust the placement of the lights.

8. Press the button to activate the lights.

Your eyeballs are complete!

If your fan is not working, double check the placement of each of your connections. You may also need to check the battery power if you are not seeing results. Try different methods of controlling the eyeballs, like the littleBits slide dimmer or noise sensor.
