

How do I create a calculated column?

In the Full Grade Center, you can calculate grades with calculated columns. Calculated columns combine data from multiple columns to attain performance results (examples: class averages, final grades that are based on a weighted scale, or total points). You can display these columns to the student so they can view performance results, or you can display them only in the Full Grade Center for your use.

The available calculated columns include the following:

- **Total Column** – A calculated column that generates a grade based on the cumulative points earned, related to the points allowed. You can select which columns and categories are included in a total column’s calculation.
- **Weighted Column** – The weighted column generates a grade based on the result of selected columns and categories, and their respective percentages. When you create a weighted column, you can include other calculated columns and other weighted columns.
- **Average Column** – A calculated column that displays the average for a selected number of columns.
- **Minimum/Maximum Column** – A calculated column that displays either the minimum or maximum grade for a selection of columns.
