TTUISD: Science 8 (SCI 8B) v.3.0, Second Semester

TEKS: §112.20 Science, Grade 8, Beginning with School Year 2010-2011

Text: *Science Level Blue* (2008) ISBN 978-0-07-877810-0

TEKS Requirement (Secondary)		Sem. B	Lesson & Assignment Number	Textbook Chapter/Page #	Bloom's Taxonomy
(a) Introduction.					
(1) Science, as defined by the National Academy of Sciences, is the "use of evidence to construct testable explanations and predictions of natural phenomena, as well as the knowledge generated through this process." This vast body of changing and increasing knowledge is described by physical, mathematical, and conceptual models. Students should know that some questions are outside the realm of science because they deal with phenomena that are not scientifically testable.					
(2) Scientific hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions become theories. Scientific theories are based on natural and physical phenomena and are capable of being tested by multiple, independent researchers. Students should know that scientific theories, unlike hypotheses, are well-established and highly reliable, but they may still be subject to change as new information and technologies are developed. Students should be able to distinguish between scientific decision-making methods and ethical/social decisions that involve the application of scientific information.					
(3) Grade 8 science is interdisciplinary in nature; however, much of the content focus is on earth and space science. National standards in science are organized as multi-grade blocks such as Grades 5-8 rather than individual grade levels. In order to follow the grade level format used in Texas, the various national standards are found among Grades 6, 7, and 8. Recurring themes are pervasive in sciences, mathematics, and technology. These ideas transcend disciplinary boundaries and include change and constancy, patterns, cycles, systems, models, and scale.					
(4) The strands for Grade 8 include:					
(A) Scientific investigation and reasoning.					
(i) To develop a rich knowledge of science and the natural world, students must become familiar with different modes of scientific inquiry, rules of evidence, ways of formulating questions, ways of proposing explanations, and the diverse ways scientists study the natural world and propose explanations based on evidence derived from their work.					
(ii) Scientific investigations are conducted for different reasons. All investigations require a research question, careful observations, data gathering, and analysis of the data to identify the patterns that will explain the findings. Descriptive investigations are used to explore new phenomena such as conducting surveys of organisms or measuring the abiotic components in a given habitat. Descriptive statistics include frequency, range, mean, median, and mode. A hypothesis is not required in a descriptive investigation. On the other hand, when conditions can be controlled in order to focus on a single variable, experimental research design is used to determine causation. Students should experience both types of investigations and understand that different scientific research questions require different research designs.					
(iii) Scientific investigations are used to learn about the natural world. Students should understand that certain types of questions can be answered by investigations, and the methods, models, and conclusions built from these investigations change as new observations are made. Models of objects and events are tools for understanding the natural world and can show how systems work. Models have limitations and based on new discoveries are constantly being modified to more closely reflect the natural world.					
(B) Matter and energy. Students recognize that matter is composed of atoms. Students examine information on the Periodic Table to recognize that elements are grouped into families. In addition, students understand the basic concept of conservation of mass. Lab activities will allow students to demonstrate evidence of chemical reactions. They will use chemical formulas and balanced equations to show chemical reactions and the formation of new substances.					
(C) Force, motion, and energy. Students experiment with the relationship between forces and motion through the study of Newton's three laws. Students learn how these forces relate to geologic processes and astronomical phenomena. In addition, students recognize that these laws are evident in everyday objects and activities. Mathematics is used to calculate speed using distance and time measurements.					

(D) Earth and space. Students identify the role of natural events in altering Earth systems. Cycles within Sun, Earth, and Moon systems are studied as students learn about seasons, tides, and lunar phases. Students learn that stars and galaxies are part of the universe and that distances in space are measured by using light waves. In addition, students use data to research scientific theories of the origin of the universe. Students will illustrate how Earth features change over time by plate tectonics. They will interpret land and erosional features on topographic maps. Students learn how interactions in solar, weather, and ocean systems create changes in weather patterns and climate.					
(E) Organisms and environments. In studies of living systems, students explore the interdependence between these systems. Interactions between organisms in ecosystems, including producer/consumer, predator/prey, and parasite/host relationships, are investigated in aquatic and terrestrial systems. Students describe how biotic and abiotic factors affect the number of organisms and populations present in an ecosystem. In addition, students explore how organisms and their populations respond to short- and long-term environmental changes, including those caused by human activities.					
(b) Knowledge and skills.					
(1) Scientific investigation and reasoning. The student, for at least 40% of instructional time, conducts laboratory and field investigations following safety procedures and environmentally appropriate and ethical practices. The student is expected to:					
(A) demonstrate safe practices during laboratory and field investigations as outlined in the Texas Safety Standards; and					Apply
(B) practice appropriate use and conservation of resources, including disposal, reuse, or recycling of materials.					Apply
(2) Scientific investigation and reasoning. The student uses scientific inquiry methods during laboratory and field investigations. The student is expected to:					
(A) plan and implement comparative and descriptive investigations by making observations, asking well-defined questions, and using appropriate equipment and technology;					Apply
(B) design and implement comparative and experimental investigations by making observations, asking well-defined questions, formulating testable hypotheses, and using appropriate equipment and technology;					Apply
(C) collect and record data using the International System of Units (SI) and qualitative means such as labeled drawings, writing, and graphic organizers;					Apply
(D) construct tables and graphs, using repeated trials and means, to organize data and identify patterns; and					Apply
(E) analyze data to formulate reasonable explanations, communicate valid conclusions supported by the data, and predict trends.					Analyze
(3) Scientific investigation and reasoning. The student uses critical thinking, scientific reasoning, and problem solving to make informed decisions and knows the contributions of relevant scientists. The student is expected to:					
(A) in all fields of science, analyze, evaluate, and critique scientific explanations by using empirical evidence, logical reasoning, and experimental and observational testing, including examining all sides of scientific evidence of those scientific explanations, so as to encourage critical thinking by the student;					Create
(B) use models to represent aspects of the natural world such as an atom, a molecule, space, or a geologic feature;		**B**	3	14	Apply
(C) identify advantages and limitations of models such as size, scale, properties, and materials; and		**B**	1, 3	11, 14	Remember
(D) relate the impact of research on scientific thought and society, including the history of science and contributions of scientists as related to the content.		**B**	6	19	Understand
(4) Scientific investigation and reasoning. The student knows how to use a variety of tools and safety equipment to conduct science inquiry. The student is expected to:					
(A) use appropriate tools to collect, record, and analyze information, including lab journals/notebooks, beakers, meter sticks, graduated cylinders, anemometers, psychrometers, hot plates, test tubes, spring scales, balances, microscopes, thermometers, calculators, computers, spectroscopes, timing devices, and other equipment as needed to teach the curriculum; and		**B**	Throughout course	11, 13-24	Apply
(B) use preventative safety equipment, including chemical splash goggles, aprons, and gloves, and be prepared to use emergency safety equipment, including an eye/face wash, a fire blanket, and a fire extinguisher.		**B**	5		Apply
(5) Matter and energy. The student knows that matter is composed of atoms and has chemical and physical properties. The student is expected to:					
(A) describe the structure of atoms, including the masses, electrical charges, and locations, of protons and neutrons in the nucleus and electrons in the electron cloud;		**B**	3	14	Understand
(B) identify that protons determine an element's identity and valence electrons determine its chemical properties, including reactivity;		**B**	3	14	Remember
(C) interpret the arrangement of the Periodic Table, including groups and periods, to explain how properties are used to classify elements;		**B**	4	15	Understand

(D) recognize that chemical formulas are used to identify substances and determine the number of atoms of each element in chemical formulas containing subscripts;		**B**	5	17	Remember
(E) investigate how evidence of chemical reactions indicate that new substances with different properties are formed; and		**B**	5	17	Evaluate
(F) recognize whether a chemical equation containing coefficients is balanced or not and how that relates to the law of conservation of mass.		**B**	5	17	Remember
(6) Force, motion, and energy. The student knows that there is a relationship between force, motion, and energy. The student is expected to:					
(A) demonstrate and calculate how unbalanced forces change the speed or direction of an object's motion;		**B**	6	19	Apply
(B) differentiate between speed, velocity, and acceleration; and		**B**	6	19	Analyze
(C) investigate and describe applications of Newton's law of inertia, law of force and acceleration, and law of action-reaction such as in vehicle restraints, sports activities, amusement park rides, Earth's tectonic activities, and rocket launches.		**B**	6	19	Analyze
(7) Earth and space. The student knows the effects resulting from cyclical movements of the Sun, Earth, and Moon. The student is expected to:					
(A) model and illustrate how the tilted Earth rotates on its axis, causing day and night, and revolves around the Sun causing changes in seasons;		**B**	1	11	Understand
(B) demonstrate and predict the sequence of events in the lunar cycle; and		**B**	1	11	Understand
(C) relate the position of the Moon and Sun to their effect on ocean tides.		**B**	1	11	Understand
(8) Earth and space. The student knows characteristics of the universe. The student is expected to:					
(A) describe components of the universe, including stars, nebulae, and galaxies, and use models such as the Herztsprung-Russell diagram for classification;		**B**	2	13	Understand
(B) recognize that the Sun is a medium-sized star near the edge of a disc-shaped galaxy of stars and that the Sun is many thousands of times closer to Earth than any other star;		**B**	1	11	Remember
(C) explore how different wavelengths of the electromagnetic spectrum such as light and radio waves are used to gain information about distances and properties of components in the universe;		**B**	7		Analyze
(D) model and describe how light years are used to measure distances and sizes in the universe; and					Understand
(E) research how scientific data are used as evidence to develop scientific theories to describe the origin of the universe.		**B**	1	11	Analyze
(9) Earth and space. The student knows that natural events can impact Earth systems. The student is expected to:					
(A) describe the historical development of evidence that supports plate tectonic theory;					Understand
(B) relate plate tectonics to the formation of crustal features; and					Understand
(C) interpret topographic maps and satellite views to identify land and erosional features and predict how these features may be reshaped by weathering.					Understand
(10) Earth and space. The student knows that climatic interactions exist among Earth, ocean, and weather systems. The student is expected to:					
(A) recognize that the Sun provides the energy that drives convection within the atmosphere and oceans, producing winds and ocean currents;		**B**	9		Remember
(B) identify how global patterns of atmospheric movement influence local weather using weather maps that show high and low pressures and fronts; and		**B**	10		Remember
(C) identify the role of the oceans in the formation of weather systems such as hurricanes.		**B**	9		Remember
(11) Organisms and environments. The student knows that interdependence occurs among living systems and the environment and that human activities can affect these systems. The student is expected to:					
(A) describe producer/consumer, predator/prey, and parasite/host relationships as they occur in food webs within marine, freshwater, and terrestrial ecosystems;					Understand
(B) investigate how organisms and populations in an ecosystem depend on and may compete for biotic and abiotic factors such as quantity of light, water, range of temperatures, or soil composition;					Evaluate
(C) explore how short- and long-term environmental changes affect organisms and traits in subsequent populations; and					Evaluate
(D) recognize human dependence on ocean systems and explain how human activities such as runoff, artificial reefs, or use of resources have modified these systems.					Remember
