AOUDAD: A GOAT IN SHEEP’S CLOTHING?
Zoe M. Bixler¹, Emily A. Wright¹, and Robert D. Bradley¹,2

Discussion
• Wright et al. (2022) demonstrated the presence of three mitochondrial lineages in the US, however, there does not appear to be any significant variation in Sry and PRNP genes.
• Although there is a lack of phylogenetic support across 2 of the 3 markers, the genetic distances, as indicated by the length of branches, indicate that aoudad are more similar to goats than to sheep.
• In addition, mtDNA and Sry indicate that aoudad are placed in a unique clade that shares a common ancestor with goats.

Materials and Methods
• 232 aoudad samples were obtained from free-ranging individuals collected between 2018 - 2021 and 19 captive aoudad samples were collected from Fossil Rim.
• Genomic DNA was extracted from tissue samples using the Qiagen Dneasy blood and tissue kit.
• DNA was amplified, purified, and sequenced for four genetic markers: Cytochrome-b (Cytb), displacement loop (D-loop), Sex determining region Y (Sry), and prion protein (PRNP).
• Gene sequences for all four markers were obtained from GenBank from Family Bovidae for comparison to A. lervia.
• A Bayesian analysis was conducted to determine phylogenetic relationships to A. lervia.

Introduction
• There are 6 known native subspecies of aoudad: Ammotragus l. lervia (Atlas Aoudad), A. l. ornatus (Egyptian Aoudad), A. l. blainei (Kordofan Aoudad), A. l. fassini (Libyan Aoudad), A. l. angusi (Air Aoudad), and A. l. sahariensis (Saharan Aoudad)
• Serological, chromosomal, morphological, anatomical, and other molecular datasets indicate aoudad share characters similar to both goats and sheep.
• For example, aoudad have a similar chromosome number (54) to sheep (the chromosome number of goats is 58) whereas aoudad possess scent glands similar to goats (sheep lack these).
• Aoudad can interbreed with goats, but not with sheep, leading some to believe they are more similar to goats. However, Giest (1971) posits that aoudad are ancestors to goats and sheep, and that aoudad were not in close proximity with goats, so no reproductive barrier evolved between aoudad and goats, unlike aoudad and sheep.

Implications and Future Directions
It is important to determine their genetic similarity to other species in the Tribe Caprini in order to evaluate any potential environmental impacts. Similar evolutionary trajectories are a key risk factor for pathogen spillover and associated disease-induced population declines in wildlife, which is corroborated by the genetic similarity between strains of M. ovipneumoniae documented in both domestic and wild sheep and goats. Genetic distances, along with divergence events will provide more insight on phylogenetic relationships among taxa in Family Bovidae compared to aoudad.

Acknowledgments
We would like to thank the Honors College Undergraduate Research Scholars Program supported by the CH and Helen Jones Foundations. Many thanks also to the members of the Bradley Lab for their assistance. Finally, thank you to the Natural Science and Research Laboratory for assistance with sample collection.
